## **Trilux® 33 Antifouling Arrives in Australia**

The much anticipated Trilux® 33 antifouling from International is now available in Australia. Trilux® 33 is the latest globally proven, high performance antifouling for aluminium hulls. It has been specifically formulated with controlled release Biolux® technology to give the best results, even in warm water areas where the fouling is notoriously challenging.

Trilux® 33 can also be applied to fibreglass, wood and other underwater metals and because of its slow polishing system it is suitable for fast, active craft as polish-through at high speeds is avoided.

How does Biolux Technology work? As sunlight diffracts through the water, it provides energy for algae to use in colonising on the boat hull. Biolux acts at the surface of the paint film to inhibit the algae's ability to conduct photosynthesis. Algae cannot therefore grow on the surface of the paint which in turn allows the antifouling to perform without interference.

Because of its unique formulation Trilux® 33 colours are brighter than most antifouling. It is available in black and a range of vibrant colours including white, red and blue. It has long lasting colour stability and is available in a 3.785L can.

For further information call our free technical helpline on 1800 251 431 in Australia and 0800 808 807 in New Zealand.
